Annular Cutters

ANNULAR CUTTERS PRODUCT KNOWLEDGE

Cutting holes in tube and pipe poses a few problems. These problems can be overcome by the use of an ANNULAR CUTTER. Due to the annular cutter being hollow there is no "dead zone" (as in the use of a twist drill), so dimpling and deburring are avoided, as is the deforming of the material. The use of a regular twist drill causes concerns with centering and hole location, hole roundness, hole finish, stock deformation, burrs and jagged edges of stock, and duration of operation.

Using ANNULAR CUTTERS in most tube and pipe cutting applications holes can be drilled without pre-spotting the location. Annular cutters require a smaller relief angle than twist drills as they cut the material rather than ripping through it, leaving a clean, round and virtually burr-free hole. As the annular cutter trepans the hole it leaves the centre as a solid slug and exerts minimal force on the material. The tool's multiple cutting edges distribute the load evenly resulting in fast feed rates, minimizing the thrust and horsepower needed.

Knowing how to use an ANNULAR CUTTER and what to look for can help to avoid problems and extend tool life. The annular cutter should be used with a portable magnetic drill with pipe adaptor securely fixed and wrapped with chain.

Q & A

1. What causes Annular Cutters to break or dull prematurely?
   Primarily a feed rate which is too slow. Using a firm, steady feed pressure throughout the cut will maximize performance and extend tool life.
2. Why should chips be cleared before each cut?
   As the cutter begins removing material, new chips flow out though the gullets and up the flutes. If these pathways are not cleared before each new hole is cut, packing or binding may result, causing the cutter to fill with chips and possibly break.
3. When should a magnetic drill be used?
   Jockeying a large pipe into position on a stationary drill is awkward – a portable magnetic drill takes the tool to the workpiece. A portable magnetic drill press may also be used in any position – vertical, horizontal, or overhead. The workpiece must be at least 3/8" thick.
4. Is the magnet on the portable drill press strong enough to drill pipe?
   When using a portable drill press a support system is needed. A safety chain or strap is recommended. When using a magnetic drill and pipe adaptor accessory, mount the adaptor securely to the pipe with a tightly wrapped chain. Make sure the support system for the drill arbor is rigid and in good condition.
5. How is the magnetic drill kept from slipping?
   The magnetic drill base should be kept clear of chips and debris and securely attached to a clean work place. Uneven surfaces or large debris buildup prevent the magnet from obtaining optimum hold, which may cause the drill to shift or lift during operation.
6. What makes the slug stick in the cutter?
   Using a lubricant or cutting fluid makes the slug easier to eject at the end of a cut. But, if the slug ejection becomes unreliable or the tube resists cutting, it probably means that the cutters edges are becoming dull – resharpen or replace the cutter.
7. Is coolant necessary?
   Always use some form or coolant when drilling to maintain cutting performance and tool life. Any form of coolant will help, even water is better than nothing.

SMART-BIT®

Why SMART-BIT®?

SMART-BIT®, the first pre-drilling and countersinking tool specifically designed for deck builders

Decks have undergone an evolution in recent years, from being part of the backyard to part of a home's primary living space. Along with this change has come the expanded use of preferred decking materials like composites and hardwoods. Stainless steel deck screws, long recognized as the fastener of choice for high-end decks, have also witnessed expanded use. Stainless steel, however, is softer than hardened steel and often requires pre-drilling with preferred decking materials. In the past, pre-drilling was time consuming and laborious. But with the introduction of the original SMART-BIT®, pre-drilling and countersinking could be done in one step, with one tool, more quickly and more easily than ever before.

Just match SMART-BIT® to your stainless steel deck screw size and the once difficult task of pre-drilling an entire deck becomes quick and easy. That's smart!

And now, SMART-BIT® is even smarter! The new SMART-BIT® has POWERBOLIC® drill bits with special fluting that cuts through decking more than twice as fast as standard wood bits. Plus, the bits are replaceable! For deck builders working with composites, SMART-BIT® offers an additional benefit -- it eliminates mushrooming (the formation of small mounds of waste material near the screw hole surface).

SMART-BIT® is perfect for the installation of composite and hardwood decks, and is also great for general woodworking applications.
